

Overview of the Low-FODMAP Diet

The Low-FODMAP Diet was developed at Monash University in Australia as an approach for supporting individuals with functional gut disorders. It involves avoidance of foods that contain specific types of carbohydrates. **FODMAP** is an acronym that stands for **F**ermentable **O**ligosaccharides, **D**isaccharides, **M**onosaccharides, **And Po**lyols. These are specific types of carbohydrates that some individuals may be unable to efficiently absorb. Since they aren't getting absorbed, certain bacteria in the digestive tract start to feed on them. These bacteria then produce byproducts and waste that can lead to symptoms such as gas, bloating, and diarrhea. This can also lead to an overgrowth of bacteria in the small intestine which can contribute to several other health problems.

What specific foods are to be avoided and what foods are okay to eat?

Foods that contain higher levels of FODMAPs are to be avoided while on the diet; some examples of foods that are to be avoided (high-FODMAP) and those that are permitted (low-FODMAP) are as follows.

Animal Protein

Meats, poultry, and seafood themselves don't contain carbohydrates, so they are not high in FODMAPs. However careful attention must be paid to how animal proteins are prepared. Many sauces and side dishes may contain ingredients that are not permitted while following the Low-FODMAP approach.

Legumes

Most legumes are moderate-to-high FODMAP foods. Some may be tolerated in reduced serving sizes, but these foods will likely need to be removed from the diet during an initial elimination phase.

Dairy & Alternatives

Low-FODMAP	High-FODMAP
Butter	Buttermilk
Cheeses (2 oz. or less)	Cream cheese
Cottage, Feta, Ricotta, Mozzarella, Swiss	Cream
Lactose Free Milk	■ Ice Cream
Rice/Oat Milk	Milk
Tofu/Tempeh	Sour Cream
Eggs	Yogurt

Nuts & Seeds

Low-FODMAP	High-FODMAP
■ Brazil nuts	Almonds
Chestnuts	Cashews
Chia seeds	Coconut
Flax seeds	Hazelnuts
Macadamias	Pistachios
Peanuts	Sesame seeds
Pecan halves	Sunflower seeds
Pine nuts	
Pumpkin seeds	
Walnut halves	

Fats & Oils

Low-FODMAP	High-FODMAP
Almond oil	Avocado (small amounts)
Avocado oil	Chocolate
Butter/ghee	Soybean oil
Coconut milk	Salad dressings
Coconut oil	Sauces with sweeteners
Olives	Sauces with high FODMAP additives
Olive oil (extra virgin)	
Rice bran oil	
Safflower	
Sesame oil	
Sunflower oil	
Walnut Oil	

Vegetables

Low-FODMAP	High-FODMAP
Carrots	Artichoke
Chives	Asparagus
Eggplant	■ Garlic
■ Green Beans	Many Legumes (beans)
Kale	Mushrooms
Potato	Onions
Zucchini	Soy Beans

Fruits

Low-FODMAP	High-FODMAP
Blueberries	Apples
Cantaloupe	Blackberries
Grapes	Cherries
Lemon	Mango
Oranges	Pear
Pineapple	Watermelon
Strawberry	

Sweeteners

Low-FODMAP	High-FODMAP
Glucose	Agave
Maple Syrup	High fructose corn syrup (HFCS)
Sucrose (table sugar)	Honey
	 Sugar Alcohols: Maltitol, Mannitol, Sorbitol, Xylitol

Why are some sweeteners (like glucose) allowed and others are not?

This all has to do with absorption. Glucose is a carbohydrate (sugar) that most people can easily absorb. Other sweeteners have carbohydrates that may be not as easily absorbed. For example, symptoms can occur when there is more fructose than glucose in a food; this is why some fruits are included in the Low-FODMAP diet while others are not.

Flavors

One challenge with the Low-FODMAP Diet is the restriction on using garlic and onions. FODMAPS aren't soluble in oils, so garlic and onions can be sautéed for about 5 minutes in olive oil and then discarded. The resulting flavored oil can be used to flavor to dishes while leaving out the parts that cause symptoms. Additionally, the green parts of scallions are safe to use, as are chives and most spices such as salt, pepper, and chile peppers.

How should you implement the Low-FODMAP Diet?

- Print out this handout of high and low-FODMAP foods.
- Organize your kitchen by identifying foods that should be eliminated, and stocking up on low-FODMAP foods.
- Pick a day to start the program. The program is typically done in three phases:

Elimination:	Remove all high-FODMAP foods for 4-8 weeks. If FODMAPs are the issue, symptoms should improve significantly during this time.
Reintroduction:	Return to your healthcare provider to evaluate the results of the Elimination phase. If you have had a positive response, consider reintroducing FODMAPs slowly and specifically, one at a time, while closely monitoring for the reemergence of symptoms.
Maintenance:	A long-term eating plan can be designed with your healthcare provider that includes the addition of foods that seem to be tolerated (in both quality and quantity) and continued avoidance of foods that cause negative symptoms.
